

# A-CLIP

Aslon Systems has developed a highly intelligent, patented terrace clip that can be used in combination with all Aslon aluminium beams to quickly and easily install decking boards with a groove, without the need for screws.

The clip is installed in the aluminium beams by a twisting motion. Once installed, the clip can be inserted into the groove of the decking board using a convenient tool, eliminating the need for screwing. This combination of the clip and aluminium beams can save a significant amount of time during terrace installation.

A variety of different decking boards with the same width on both the top and bottom can be installed using 1 type of clip. This provides a tremendous advantage in terms of inventory management and eliminates the possibility of errors caused by supplying the wrong clip.

The choice of material, specifically aluminium 1.4310 – AISI 301, and the shape of the clip ensure gripping force both on and within the decking boards as well as in the aluminium beams.

## CLICK AND TWIST

Due to the clip's smart shape, a terrace is easily installed.

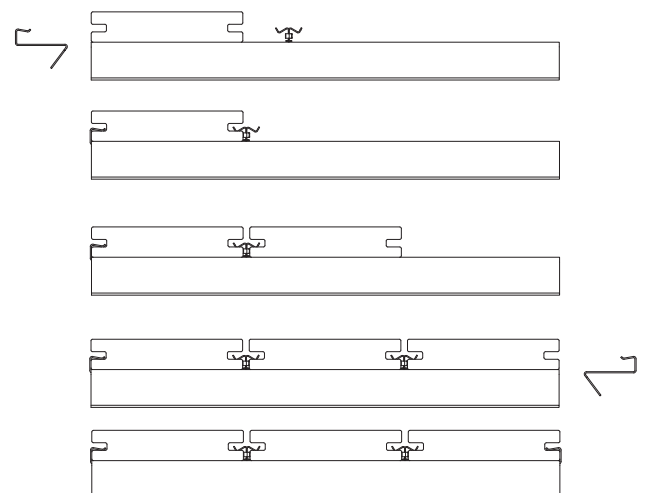

## SCREWLESS

The clip's smart design allows easy installation of a facade or terrace without the use of screws.

## FIRE CLASS

Due to the product composition of stainless steel, the clip has the correct fire classification.
